Water and sewage treatment

At NAVSUPPLY, rainwater and water from other sources is collected, treated and used as reuse water to irrigate the gardens, as well as for other non-potable uses in the company. The sanitary effluent is treated by NAVSUPPLY with more restrictive criteria than those determined by the legislation. Thus, the water, after being reused and treated, is returned to the environment in a responsible way.

Energy

With the commitment to avoid energy waste, NAVSUPPLY uses the most energy-efficient equipment and materials, such as high-performance motors, LED lamps, and other environmentally friendly solutions. In addition to using energy resources efficiently, the company will start supplying the consumption of its main units with 100% renewable energy.

Emission of Greenhouse Gases

NAVSUPPLY is implementing the renewable energy system, solar, to supply 100% of the consumption of its main units, and thus avoid, each year, the emission of hundreds of tons of Greenhouse Gases (GHG) into the atmosphere, contributing to the global goals of GHG reduction, determined in the Paris Agreement.

Waste Control

With the Solid Waste Management Program (PGRS), NAVSUPPLY defines the procedures for separation, temporary storage, transportation and final disposal of all its waste.
